

Hose Thread Setup with Galcon Alternator Valve (TGNALT)

Save the expense of a second timer or manifold. This hose threaded Galcon Alternator Valve (TGNALT) will double the coverage of your drip irrigation system. With each timer cycle the internal valve switches between Outlet 1 and Outlet 2, redirecting the flow of water from one side to the other. The red arrow on the front of the unit clearly indicates which outlet will open next, letting you know at a glance where you are within the cycle. A high pressure hose extension (HPEX3) at the start of this setup will help take the weight off your spigot or stand pipe.
