

## Air Bleed Valves

VAB1

VAB34

VAB12

Minimum activation pressure is 5 PSI  
Maximum working pressure is 80 PSI

Drip tape installations on uneven terrain, systems with radical elevation changes, and long tree lines over 500' can develop air locks in the system. Installing one of these devices at the system's high points can help to eliminate those air locks and keep buried lines from back suctioning dirt and debris that can clog supply lines and emitters.
